

Online Data Table 1: Baseline Estimates of Absolute Mobility by Parent Income Percentile and Child Birth Cohort

Description

This table reports the probability that a child earns more than their parents at age 30 by parent income percentile for each child birth cohort in the range 1940-1984. All estimates are conditional on positive parent income. The table also reports the fraction of parents with zero income for each child birth cohort and the probability that a child in a given birth cohort earns more than their parents.

Codebook

Variable	Type	Description
cohort	Num	Child birth cohort
base_absmob_pos_par[percentile]	Num	Probability that a child at a given parent income percentile earns more than their parents
par_frac0	Num	Fraction of parents with zero income
cohort_mean	Num	Mean probability for a child from a given birth cohort to earn more than their parents
